

STICK

Manuale

The Joystick actuating way is very short but high precise. The actuating direction horizontal/vertical can be switched via the button **+**. **Reverse Direction** switches Motor turn direction. The **Speed** poti controls the motorspeed in combination with the pressure onto the joystick. The stick can be **mounted** on diameters from 1" upto 1,15" with screws in different length.

Connecting the stick onto power will cause a **zero calibration** of the joystick. During this calibration the **LED** lights red. During this periode it is very important that the joystick isn't touched or grabed. Will be this function not correctly stored (**motor turns itself**) reconnect the stick to restart the adjustment. **Attention: For the Canon and Angenieux cable it is more than important that the connectors retaining nut on the lens side is very tight connected !**

Accessories:

ST-FU cable for Fujinon
ST-CA cable for Canon
ST-AN cable for Angenieux

"Schnitte" for external Digitalmotors

CE
